

Abstract of the Disclosure

Systems and processes for interactive services are provided. A user-interactive application may be implemented to provide a specific service, such as a wagering service, to a user through a mobile wireless communications device. The application may be implemented partly on the mobile wireless communications device and partly in other equipment used to provide the service. The current location of the user may be determined based on determining where the user is operating the mobile wireless communications device. The application may respond differently to user selections based on where the user is currently located. For wagering systems, wagering may be prevented when the user is operating the mobile wireless communications device from a locality where wagering is not legal.
